

Connecting to the FSU Palo Alto VPN

Step-by-step guide

1. Open a browser to <https://vpn.frostburg.edu>
2. Login using your FSU user credentials without the '@frostburg.edu'
3. You will be directed to a page where you will be able to download the appropriate client for use with the VPN. Once you click on the appropriate link, select to run the client install.
4. Once downloaded run the install and select all of the defaults.
5. Once installed, you may close the install and browser windows.
6. You are then presented with the client login application (Global Protect).
7. In the portal field enter: vpn.frostburg.edu and then enter your user credentials in the other field without the '@frostburg.edu'. Click connect.
8. Once connected you may minimize the client.

For future connections, you will only need to launch the client and not the browser. In the future, you will be prompted for any client upgrades as they become available.

When you are finished, be sure to click the disconnect button to log off the VPN and close your client window.

To manually connect to network drives, in the search field on your computer type the following and press enter:

For your H drive- \\fsunas1\usersdir\username (where username is your FSU username)

For your P drive- \\fsunas1\deptshares (then scroll down to find your department's particular folder)

For your U drive- \\fsunas1\deptshares\campus\$

If you are connecting from a non-FSU owned computer, you will be prompted for credentials. Enter your FSU username and password in the format username@frostburg.edu.
